DAELIBS DL4 Logger GSM Wireless Data Transfer

A snap-shot:

- There is no need for the DAELIBS DL4 Logger to be returned to base for down loading.
- DAELIBS GSM Download Software transfers the data over the Wireless Mobile Phone Network from the Logger to the SeeknFind database.
- The data is transferred using either a computer generated automatic download process or by an operator generated call out for data transfer. SeeknFind up to date service contact information.
- The Logger is ideally suited to be used by service providers with a need to record service attendances by mobile workers to dispersed locations.
- It is suited to security and cleaning companies, maintenance services or in-the-home personal care services.
- Data from the Logger can be managed with a customised SeeknFind software package or interfaced with a range of specialised service management programs.
